(54) Title: OXAZOLIDINONE THIOAMIDES WITH PIPERAZINE AMIDE SUBSTITUENTS

(57) Abstract: The present invention provides a compound of formula (I)  
which has potent activities against gram-positive and gram-negative bacteria.

## OXAZOLIDINONE THIOAMIDES WITH PIPERAZINE AMIDE SUBSTITUENTS

## FIELD OF THE INVENTION

The present invention relates to novel oxazolidinone thioamides which have new  
5 piperazine amide substituents; and their preparations. These compounds have potent  
activities against gram positive and gram-negative bacteria.

## BACKGROUND OF THE INVENTION

The oxazolidinone antibacterial agents are a novel synthetic class of antimicrobials  
10 with potent activity against a number of human and veterinary pathogens, including  
gram-positive aerobic bacteria such as multiply-resistant staphylococci and streptococci,  
anaerobic organisms such as bacteroides and clostridia species, and acid-fast organisms  
such as *Mycobacterium tuberculosis* and *Mycobacterium avium*.

However, oxazolidinones generally do not demonstrate an activity at a useful level  
15 against aerobic gram-negative organisms. Thus, the use of these oxazolidinone  
antibacterial agents is limited to infectious states due to gram-positive bacteria.  
Accordingly, it is among the objects of the present invention to provide pharmaceutical  
compounds which have broader antibacterial activity including the activity against aerobic  
gram-negative organisms. We have now discovered that the oxazolidinone thioamides of  
20 the present invention increase the spectrum of activity to include gram-negative organisms  
such as *Haemophilus influenza* and *Moraxella catarrhalis*.

## DETAILED DESCRIPTION OF THE INVENTION

The following definitions are used, unless otherwise described.

25 The term alkyl, alkenyl, etc. refer to both straight and branched groups, but reference to an individual radical such as "propyl" embraces only the straight chain radical, a branched chain isomer such as "isopropyl" being specifically referred to.

The carbon atom content of various hydrocarbon-containing moieties is indicated by a prefix designating the minimum and maximum number of carbon atoms in the moiety, 30 i.e., the prefix  $C_{i-j}$  indicates a moiety of the integer "i" to the integer "j" carbon atoms, inclusive. Thus, for example,  $C_{1-7}$  alkyl refers to alkyl of one to seven carbon atoms, inclusive.

Mammal refers to human or animals.

15 Scheme I describes the preparation of compounds of the present invention. All of the starting materials are prepared by procedures described in these schemes or by procedures that would be well known to one of ordinary skill in organic chemistry. The variables used in Schemes I are as defined below or as in the claims. Optically pure material could be obtained either by one of a number of asymmetric syntheses or

20 alternatively by resolution from a racemic mixture.

In step 1 of Scheme I, a suitably protected piperazine (II) is allowed to react with an activated carboxylic acid derivative to give compounds III. In this reaction activated carboxylic acid derivatives can include acyl halides and acid anhydrides or mixed anhydrides which are allowed to react with II in the presence of a tertiary amine base such

25 as triethylamine or pyridine in solvents such as methylene chloride, tetrahydrofuran (THF) or excess pyridine. Temperatures in the range of about 0°C to about 24°C are generally suitable for this reaction. Alternatively coupling agents which are well known for amide forming reactions can be used with appropriate carboxylic acids in step 1. Reagents such as dicyclohexylcarbodiimide (DCC) and 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide

30 hydrochloride (EDC) can be used with activating agents such as 1-hydroxybenzotriazole (HOBT) or 4-(dimethylamino)pyridine (DMAP) in this reaction. Solvents such as THF or dimethylformamide (DMF) and temperatures in the range of 0°C to 24°C are suitable. Compounds where R<sub>4</sub> is cyano are prepared by allowing compounds II to react with

cyanogen bromide in solvents such as methanol. Sodium acetate is a suitable base for this reaction which can be carried out at temperatures in the range of 0°C to 24°C (See Example 5). Protecting groups (P) are chosen for their compatibility with other functional groups on the molecule. Benzyloxycarbonyl (Cbz) and *tert*-butoxycarbonyl (Boc) are generally  
5 suitable protecting groups for these compounds; however, it is sometimes necessary to employ other protecting groups. Example 1 illustrates the use of the phthalimide protecting group. In this example, the sulfoxide is sensitive to the acidic conditions required for Boc group removal. The phthalimide can be removed under non-acidic conditions with hydrazine hydrate or methylamine.

10 In step 2 of Scheme 1, the protecting group (P) is removed to give the corresponding amines (IV). It is convenient to remove the Boc group with hydrogen chloride in dioxane at 0°C to 24°C; however, other deprotection strategies can be employed. Deprotection of Cbz groups can generally be accomplished by hydrogenation with a palladium catalyst.

In step 3 of Scheme 1, the amines (IV) are converted to compounds of formula I.  
15 Thioamides are prepared by allowing compounds IV to react with dithioesters and a tertiary amine base such as triethylamine. In this reaction it is often convenient to employ an excess of the tertiary amine base with an amine salt prepared by Boc deprotection in step 2 without first isolating the free base. Solvents such as THF, methylene chloride or preferably methanol and temperatures in the range of about 24°C to about 50°C can be used  
20 for this reaction. Other thiocarbonyl compounds of formula I can be prepared according to the procedures disclosed in PCT International Publication WO 98/54161.

If desired R<sub>4</sub> of compounds I or III can be modified to give additional compounds of formula I. This is illustrated in Example 4 where the acetamide of 14 is allowed to react with Lawesson's reagent to give the thioamide 15, a compound of formula I. In Example 1  
25 it is shown in step 3 that the sulfide 3 can be oxidized to the sulfoxide 4 with sodium periodate in methanol-water. This intermediate 4 can subsequently be converted to a compound of formula I. The reaction of sulfoxides such as 4 (Example 1) with sodium azide in polyphosphoric acid at temperatures in the range of 40°C to 70°C gives sulfoximine intermediates that can also be converted to the corresponding compounds of  
30 formula I (R<sub>4</sub> is -C(=O)-CH<sub>2</sub>-S(=O)(=NR<sub>8</sub>)CH<sub>3</sub>). Other sulfoximine analogs can be obtained as described in Case 6295. In Example 3 it is shown that the sulfide intermediate 8 can be oxidized to the sulfone 11 with osmium tetroxide and 4-methylmorpholine N-oxide in acetone-water. Intermediate 11 can subsequently be converted to compound 13, a

compound of formula I. In Example 6 it is shown that the alcohol **19** will react with methylisocyanate and a cuprous chloride catalyst in DMF at 24°C to give **20** which can be converted to **22**, a compound of formula I. And in Example 7 acylation of the alcohol **23** with 2-methoxyethyl chloroformate in pyridine gives **24**, a compound of formula I. In a similar manner, using chemistry known in the art, other R<sub>4</sub> substituents of compounds I or III of Scheme I can be modified to give additional compounds of formula I.

## SCHEME I

10

The pharmaceutical compositions of this invention may be prepared by combining the compounds of formula I of this invention with a solid or liquid pharmaceutically acceptable carrier and, optionally, with pharmaceutically acceptable adjuvants and excipients employing standard and conventional techniques. Solid form compositions include powders, tablets, dispersible granules, capsules, cachets and suppositories. A solid carrier can be at least one substance which may also function as a diluent, flavoring agent, solubilizer, lubricant, suspending agent, binder, tablet disintegrating agent, and encapsulating agent. Inert solid carriers include magnesium carbonate, magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatin, cellulosic materials, low melting wax, cocoa butter, and the like. Liquid form compositions include solutions, suspensions and emulsions. For example, there may be provided solutions of the compounds of this invention dissolved in water and water-propylene glycol and water-polyethylene glycol systems, optionally containing suitable conventional coloring agents, flavoring agents, stabilizers and thickening agents.

25

Preferably, the pharmaceutical composition is provided employing conventional techniques in unit dosage form containing effective or appropriate amounts of the active component, that is, the compounds of formula I according to this invention.

The quantity of active component, that is the compound of formula I according to  
5 this invention, in the pharmaceutical composition and unit dosage form thereof may be varied or adjusted widely depending upon the particular application, the potency of the particular compound and the desired concentration. Generally, the quantity of active component will range between 0.5% to 90% by weight of the composition.

In therapeutic use for treating, or combating, bacterial infections in warm-blooded  
10 animals, the compounds or pharmaceutical compositions thereof will be administered orally, topically, transdermally, and/or parenterally at a dosage to obtain and maintain a concentration, that is, an amount, or blood-level of active component in the animal undergoing treatment which will be antibacterially effective. Generally, such antibacterially effective amount of dosage of active component will be in the range of about 0.1 to about  
15 100, more preferably about 1.0 to about 50 mg/kg of body weight/day. It is to be understood that the dosages may vary depending upon the requirements of the patient, the severity of the bacterial infection being treated, and the particular compound being used. Also, it is to be understood that the initial dosage administered may be increased beyond the above upper level in order to rapidly achieve the desired blood-level or the initial dosage  
20 may be smaller than the optimum and the daily dosage may be progressively increased during the course of treatment depending on the particular situation. If desired, the daily dose may also be divided into multiple doses for administration, e.g., two to four times per day.

The compounds of formula I according to this invention are administered  
25 parenterally, i.e., by injection, for example, by intravenous injection or by other parenteral routes of administration. Pharmaceutical compositions for parenteral administration will generally contain a pharmaceutically acceptable amount of the compound according to formula I as a soluble salt (acid addition salt or base salt) dissolved in a pharmaceutically acceptable liquid carrier such as, for example, water-for-injection and a buffer to provide a  
30 suitably buffered isotonic solution, for example, having a pH of about 3.5-6. Suitable buffering agents include, for example, trisodium orthophosphate, sodium bicarbonate, sodium citrate, N-methylglucamine, L(+)-lysine and L(+)-arginine to name but a few representative buffering agents. The compounds according to formula I generally will be

dissolved in the carrier in an amount sufficient to provide a pharmaceutically acceptable injectable concentration in the range of about 1 mg/ml to about 400 mg/ml of solution. The resulting liquid pharmaceutical composition will be administered so as to obtain the above-mentioned antibacterially effective amount of dosage. The compounds of formula I  
5 according to this invention are advantageously administered orally in solid and liquid dosage forms.

The oxazolidinone antibacterial agents of this invention have useful activity against a variety of organisms. The in vitro activity of compounds of this invention can be assessed by standard testing procedures such as the determination of minimum inhibitory  
10 concentration (MIC) by agar dilution as described in "Approved Standard. Methods for Dilution Antimicrobial Susceptibility Tests for Bacteria That Grow Aerobically", 3rd. ed., published 1993 by the National Committee for Clinical Laboratory Standards, Villanova, Pennsylvania, USA. The activity of compounds of this invention against *Staphylococcus aureus*, *Staphylococcus epidermidis*, *Streptococcus pneumoniae*, *Enterococcus faecalis*,  
15 *Moraxella catarrhalis* and *H. influenzae* is shown in Table 1.
